Abstract (en)
[origin: CA2187608A1] A preparation device (10) for hot melt adhesives includes a base (20) which supports operational components (30, 40) within a housing (50), the operational components (30, 40) including a supply tank (30), a heater (32), a pump (34), a valve (36), an electric motor 38, a control unit (40), and couplings therebetween. The housing (50) includes a stationary section (52) and a movable section (54), both supported on the base (20). The movable section (54) moves horizontally from a closed housing position to an open housing position, thereby facilitating access to one or more of the operational components (30, 40) for periodic tasks such as repair, maintenance or cleaning. This overall structure for the preparation device (10) provides improved access to operational components (30, 40), and it also allows the operational components (30, 40) to be arranged closer together, thereby achieving another desirable feature of compactness in design.
