Abstract (en)

[origin: EP0768683A1] The feed circuit is to control a two winding (B1,B2) electromagnet. The electromagnet is either DC or provided with rectified AC input. The secondary coil (B2) is fed by a command transistor (T2) which is in turn fed by a switching circuit(10). The switching circuit has a voltage adaptor (11) connected from the first winding and measuring the voltage level. Below a threshold level, current flows through a feed transistor (T1) to a second transistor. Above the threshold, the current flow to the second winding is switched off.
