Abstract (en)

[origin: WO9601092A1] The invention relates to an intrauterine body (10) essentially in the shape of a T for releasing an active agent comprising an elongated stem (20). To one end (21) of the stem an elongated transverse part (40) is joined so that this and the stem (20) together form the body (10) essentially in the shape of a T. According to the invention, the transverse part (40) comprises a polymer matrix reservoir (41) containing an active agent. The stem (20) may be a polymer matrix reservoir containing an active agent or a part which contains no active agent.
