Abstract (en)

[origin: EP0770667A1] A process for dehydrating natural gas or refinery gas, contg. methane and other light alkanes, BTEX (benzene, toluene, ethyl benzene and xylene), water and opt. CO<sub>2</sub>, N<sub>2</sub> and/or H<sub>2</sub>S, using a liq. desiccant, comprises: (a) absorbing water and BTEX by contact with regenerated liq. desiccant (from step (c)) to produce a dry gas stream and a loaded liq. desiccant stream; (b) separating the loaded liq. desiccant into a vapour phase, mainly contg. methane, steam and part of the BTEX, and a liq. phase mainly contg. the desiccant loaded with water and BTEX; (c) regenerating the liq. desiccant in reboiling and distillation zones, in which the distillation zone produces a vapour phase, contg. steam and BTEX, and the regenerated liq. desiccant returning to step (a); (d) condensing the vapour phase from the distillation zone, and separating the three phases, i.e. a BTEX-contg. gas stream, a BTEX-contg. liq. hydrocarbon phase and a liq. aq. phase; and (e) treating at least the BTEX-contg. gas stream in a scrubbing zone by absorbing the BTEX in a withdrawn regenerated liq. desiccant fraction and passing the BTEX-loaded desiccant to a point in the regeneration zone of step (b), the gas stream leaving the scrubbing zone being free from BTEX.
