Abstract (en)

[origin: EP0770718A1] To wind a band of yarns on a warp beam, the control roller (13) is pressed against the beam drive roller (12) by an additional setting unit (16) at the setting mechanism (15). The control on the draw forces on the band of yarns (10) is activated at the latest as soon as the setting unit (16) is no longer being adjusted. Also claimed is an appts. with a control roller (13) mounted to a swing setting lever (14) to give it a swing movement. The control roller (13), in the yarn clamping position, is moved by an additional setting unit (16) so that the draw force control can be activated and deactivated independently of the setting unit (16) control.
