Abstract (en)

[origin: EP0770917A1] The device has an input station for receiving the developed photographic film from a developing device and a second input station for receiving a film cassette. A winding mechanism for a cassette film reel, allows the developed film to be wound back onto the film reel after copying. Pref. the second input station has a cassette reception device (16) matched in shape and size to the film cassettes. A code reader scans a code along the edge of the film to indicate incorrect orientation of the film before it is fed onto the film reel.
