Abstract (en)

[origin: EP0692231A1] An absorbent article especially adapted for users ranging from walking infants to adults in a pre-dominantly lying- down position, comprises cushioning means in at least the back waist region of the article. A liquid barrier is located between the cushioning means and the absorbent core to prevent liquids from migrating into the cushioning means. In one embodiment, the average basis capacity of the absorbent core is highest in the back half section of the core. <MATH>
