Abstract (en)
[origin: WO9636784A1] An overhead door system (210) for moving a sectional door (D') having top, bottom and intermediate hinged panels (221, 222, 223, 224) between a closed vertical position proximate a door frame (212) and an open horizontal position including a substantially vertical track section (251) for engaging a plurality of rollers (237) attached to and spaced from the bottom and intermediate panels, a curved transition track section (253) commencing at the upper extremity of the vertical track section for changing the direction of travel of the plurality of rollers, a first horizontal track section (255) extending from the transition track section for receiving the plurality of rollers to support the door in the open horizontal position, a second horizontal track section (260) for guiding a top panel roller (232) positioned proximate the top (231) of the top panel from the open position to the closed position of the door, and a rear counterbalancing system (280) mounted proximate the ends (264) of the horizontal track sections remote from the door frame and operatively interrelated with the door.
