Abstract (en)

[origin: WO9513448A1] By the mounting of frames in building openings it is traditionally difficult to adjust the frames into a fully correct mounting position prior to the fixation of the frame. According to the invention this is noticeably facilitated by the use of inflatable flat bag members (6), which are inserted in the slot at the outer sides of the frame and are inflated more or less by operating an inflation ball (12) and a bleeding valve (18). With the use of such flat bag members (6) as auxiliary tools a usual window frame may be mounted easily and rapidly by a single operator.
