Abstract (en)

[origin: EP0771921A1] A cylinder security lock for locking a movable portion to a fixed portion of a structure to be locked comprises a mechanical closure device (3) fixed to one of the movable portion and the fixed portion, a drum (4) associated with the mechanical closure device (3) and a locking cylinder (5) housed in the drum (4) and rotatable therein by means of a key (39) in order to operate the mechanical closure device (3) to engage it with the other of the said movable and fixed portions. Advantageously, the drum (4) containing the entire locking-unlocking mechanism of the lock is coupled releasably with a bush (22) fixed to the mechanical closure device (3) to enable the drum (4) to be engaged with/released from the remaining parts of the lock quickly and easily even after these have been fitted on the movable portion or on the fixed portion of the structure to be locked. <IMAGE>
