Abstract (en)
[origin: EP0772014A2] The cooling device has at least two receptacles, arranged one above the other inside a thermally insulated housing, separated by an insulated intermediate layer and with access openings separately closed by a door on the housing with a peripheral magnetic seal elastically mounted on the edge of the opening. The intermediate layer carries a contact surface for the horizontal sections of the magnetic seal on the doors. At least one of the horizontally adjacent magnetic seal sections (17) contacts a movable support surface (40) which extends at least substantially into the opening plane of the corresp. receptacle (20) and which has a bearing arrangement (41) enabling it to pivot out of the opening plane.
