Abstract (en)

[origin: WO9604631A1] Fire detection device (1) comprising a fire sensor which measures a first physical quantity and generates a measuring signal, the latter being affected by a second physical quantity which is different from the first. The device also includes a correction sensor (4) for measuring the second physical quantity and generating a correction signal. The fire sensor and the correction sensor are connected to a microprocessor (2) in which is stored a curve representing a normal operating value i_0 of the measuring signal based on the value of the correction signal in the absence of a fire. The microprocessor is programmed to calculate i_0 based on the correction signal and to determine the presence of a fire when the measuring signal is not included in the range of values determined about i_0 .
