Abstract (en)  
[origin: WO9603785A1] An in-line electrical wire connector comprises a metal insert located within a heat shrinkable sleeve. The insert comprises two overlapping portions (2, 3) for receiving wires from opposite directions. A strip of solder is disposed at the overlap and can flow through apertures in the inserts so as to effect overlapping electrical connection with the wires and the insert (2, 3). Projections (16) extend inwardly into the wire-receiving portions (2, 3) of the insert, to grip the wires and to provide a temporary electrical connection therebetween. Sealing rings (8) are provided within the heat shrinkable sleeve beyond the end of the insert (2, 3).
