Abstract (en)
[origin: EP0773338A1] The lock mechanism allows the permutation to be altered from the front via an element (4) which is secured to the base of the lock housing operated via an inserted special key (7), for displacement of the permutation blocking device (5). The latter has a nose released to allow a blocking plate (6) to pivot via a spring bias into the open position, for releasing the cog wheel packet (8) upon retraction of the lock bolt (2).
