Abstract (en)

[origin: EP0774642A1] Dispersion or application of an active material is claimed. It consists of incorporating the active material into a thixotropic gel to form a composition which is then subjected to a force in order to modify its viscosity and cause its dispersion. These compositions contain at least one active material and are dispersible on land and applicable onto an object. A projectile using the above process is also claimed. It comprises of a double jacket (2) (figure 1) in which the composition is placed. It comprises a means of dispersion (6,7,13,19) (figure 2, and 3) which causes the composition to move with respect to the jacket, resulting in its liquefaction and ejection.
