Abstract (en)
[origin: WO9605059A1] A screen or stencil printing machine has at least the following functional elements: a permeable or screen-like printing form, stencilled according to the desired image or pattern; a doctoring system that sweeps over the printing form for pressing the paint through the painting form on a printing material; and a regulating member for contacting the printing form with the printing material and for moving the printing material away from the printing form. At least two of said functional elements are linearly guided and are linked each to a separate driving unit. The driving units can be co-ordinated and actuated by a common drive control system so that said relative movements between functional elements may be matched or synchronised. The machine is characterised in that one or several linearly guided functional elements are directly linked to the rotor of an associated electromotor that linearly drives them.
