Abstract (en)

[origin: DE19521277A1] The description relates to a device for cylinder recognition in an internal combustion engine in which the rotation speed variations of individual cylinders or values dependent thereon are first stored and, when the engine is restarted, compared with the rotation speed variations then arising. Cylinders can be recognised from the results obtained from the comparison. Cylinder recognition can be used as adaptation values for detecting uneven running in connection with internal combustion engines where uneven running is to be detected.
