Abstract (en)
A roller skate comprising a series of rollers (10) which are substantially aligned along the longitudinal axis thereof is described. Each of the rollers (10) is supported in such a manner that it can rotate freely by a frame (14) which is secured to the sole of a footwear part (16). The skate provides that at least one end roller (10) of the series of rollers (10) is articulated to the frame (14) with the interposition of resilient means (28). <IMAGE>
