Abstract (en)  
[origin: EP0775533A2] The method involves sorting in accordance with a number of object properties determined by at least one test device. The characteristics of a large number of objects are first determined by the test device before sorting commences. The results are evaluated and are graduated and stored according to frequency of occurrence. During the actual sorting the characteristics of the individual objects are determined and sorting decisions made depending on comparisons with the frequencies of occurrence of measurement values made on the large number of objects.
