Abstract (en)

[origin: EP0775621A1] The bogey (8) is mounted to the underside of the carriage via a pivot and a cross support member (7). The cross member is secured to the longitudinal chassis members using elastic pads, to reduce transmission of vibrations to the carriage. The ends of the cross member have connecting flanges which are spaced from corresponding connecting flanges on the sides of the longitudinal frames by elastic pads. The mounting provides elastic support in the vertical and horizontal directions.
