Abstract (en)

[origin: EP0775875A2] The equipment has a coolant circuit (10) with two coolant compressors (1,2) which can be staggered, an air condenser (5), a water condenser (7), and a valve (11). The valve is a magnetic three-way or passage valve, and guides the coolant via one of the condensers and via a heat convactor (15) which heats the air which is cooled in the vaporiser (3), using the residual heat in the hot gas. The heat convactor may be arranged before an expansion valve (6) in the coolant circuit, in order heat the air which is cooled in the vaporiser.
