Abstract (en)

[origin: EP0776771A1] The adhesive device comprises a conveyor which has a pick-up device for securing the items. The pick-up device is coupled to an adhesion device (10) which takes the items from it. The adhesion device is connected to a control unit (14) which activates the adhesive movement. The conveyor is formed by a rotatively driven drum with the pick-up device feeding the items on its periphery. At least one grip device (8) is provided on the periphery of the drum conveyor. The adhesion device is pivotable around a parallel axis to the rotary axis (12) of the drum conveyor. A holding device is formed in the flight path of the items (2) transported by the drum conveyor and is connected at the opposite end to the control unit. The control unit is formed by a lever gear drive-connected to the drum conveyor.
