Abstract (en)

A sliding-door handle (1) with latch, in which the door (4) is provided with an upright having a plate (13) with a hole (14) for engagement of the latch (15), comprising a plate element (16) provided with a hook (17) at an end (18) designed so that rotation of its special operating body (23) about a fixed axis (24) imparts to the plate element (16) an oscillating movement as a result of which the hook (17), from an end rest position in which it is hidden inside the door (4), is projected towards the outside of the latter, until it engages with the plate (13) of the upright, hooking up with it after passing through the hole (14) thereof, and vice versa, the operating body (23) forming at least one projection defined by at least one recessed impression (2), both of which can be accessed by the user both frontally and laterally. <IMAGE>
