Abstract (en)

[origin: DE19546063C1] The bearing housing (19) is of one-piece construction with an elongated inner sill screen (22) and the at least one operating grip (20) at its free ends has a formation directed towards the vehicle exterior. The formation, with the vehicle door closed (3), engages an inner door cladding (37), so that an upward pivoting of the operating grip and a consequent unlocking of the cover is prevented. The operating device has two operating grips, whereby the front operating grip, viewed in the travel direction, is provided for a front cover and the rear operating grip for a rear cover. The operating grips are only pivoted into the upward effective position from their horizontal rest position when the vehicle door is open.
