Abstract (en)  
[origin: WO9606792A1] A dispensing apparatus (10) for serially dispensing plastic bags from a wound roll of continuous flexible plastic bags (AA) joined along perforated severance lines (24). A container (12) is provided which is adapted to receive the wound roll of plastic bags (AA). The container has a bottom (18), a pair of opposed sides (14) having an inwardly facing flange (16) extending therefrom, and separating tongue (20) projecting outward from the bottom. The flanges define a self-threading slide for threading the plastic bags from the wound roll along a predetermined path onto the separating tongue. The separating tongue separates the plastic bags from the wound roll as the plastic bags engage the separation tongue along a predetermined path of travel. A mounting bracket (22) cooperates with the bottom to mount the container to a solid surface in a plurality of different positions while maintaining the desired orientation of the container, to ensure that the wound roll is biased against the bottom and the flanges for self-braking of the wound roll and for limiting overspinning thereof as plastic bags are serially separated therefrom.
