Abstract (en)
[origin: EP0779067A2] The cabin (1) incorporates an arrangement for the supply of warm air and for the supply of steam. Seats (13), for the users of the cabin, are made from lattice work or incorporate air through holes. The seats are spaced a short distance from the walls (11) of the cabin. Heat storing material (15,17), e.g. in the form of stones, is placed under and immediately behind the seat. Water (19) is sprayed onto this material. A rotary air circulator (135) is mounted on the ceiling of the cabin. The blades of the rotor cause the rising air which is charged with steam to be fed down with a radial component to the occupants of the seats. The radial component of the flow is generated by a dome shaped guide (143) which is mounted above the rotor.
