Abstract (en)

[origin: EP0779150A1] The unit comprises a solvent recirculation circuit (6,8,10). This has a forward feed (8) for feeding cleaning fluid from a storage tank (6) to a rotary body (2) to be cleaned. A back flow (10) feeds back the cleaning fluid from the body's washing device (4,14,16). A cleaner cleans the returned dirtied cleaning fluid on its way in the back flow. The cleaner incorporates at least one ion exchanger (32), which separates out at least one of the dissolved contaminants from the cleaning fluid.
