Abstract (en)

The invention is essentially focused upon the development of elements made of a flexible material which will cover the cutting edges of the rails (2) and of the posts or vertical sections (1) which support the rails of the metallic guard-rails found in roads. They consist of a protective element for the cutting edges of the rails (2), an upper protective cap (8) which fits at the head over the upper side of the section (1) which protrudes from the rail, and lower lateral protective elements which embrace the front or rear sides of the section where it protrudes from the rail, or which independently attach to each of its flanges. <IMAGE>
