Abstract (en)
[origin: EP0780645A2] the drawer is guided in a frame along its two long sides and has a parallel guide device formed by a serrated section and two toothed rollers rigidly coupled together on the same axis. Either the serrated section is fixed in space or the rollers are. In front of the serrated section(20) is a restraint (22) which allows the outside-toothed rollers to engage with the serrated section with a movement at right angles to it. The restraint is formed as a smooth-faced coulisse-shaped input device with a first guide section to bring the rollers into a vertical position relative to the serrated section and a second guide section, leaving which the rollers immediately engage the serrated section.
