Abstract (en)

Bed (20) having transverse sections (27-32) reclinable between a horizontal bed position and a sinuous sitting position. A part of the transverse sections of the bed (20) is articulated to regulating means (34) which slide longitudinally in the frame (21) of the bed (20) against the action of elastic return means (35). Retaining means (50, 55, 56, 58) lock said regulating means (34) in positions corresponding to various inclinations of the transverse sections of the bed (20). On manually deactivating the retaining means (50, 55, 56, 58), the regulating means (34) and the transverse sections connected thereto can be moved semiautomatically into any position by the resultant of the force system consisting of the elastic return means (35) and the load which the user may variably distribute over the transverse sections connected to said regulating means (34). <IMAGE>
