Abstract (en)

[origin: WO9608981A1] A multi-part ring has at least one bearing component (10) and at least one annular section (11, 12) arranged concentrically with the bearing component, the inner side (11a, 12a) of which at least partly overlaps the outside (10a) of the bearing component (10). There is a radial groove (11b, 12b) on the inner side of the annular section. A securing component of elastic material engages in the groove (11b) of the annular section (11, 12) removable from the bearing component (10) and in the groove (10b) in the bearing component, permitting relative movement between the annular section (11, 12) and the bearing component (10). This makes it easy to exchange radially outwardly positioned annular sections where necessary while still ensuring the free movement of the annular sections in relation to the bearing component.
