Abstract (en)
[origin: WO9702777A1] An oven comprises an enclosure (1) having upper and lower sections (2, 3); an electrical heating element (9) mounted in the lower section (3) of the enclosure (1); and an open mesh support (8) positioned over the heating element (9) on which food to be cooked is located. The enclosure (1) is formed as a double wall structure to retain heat. The upper section (2) of the enclosure (1) is domed to enable heat to be converted from the heating element (9), through the open mesh support (8), onto the top of the food on the support. The upper and lower sections (2, 3) can be closed to define a sealed volume within the enclosure during cooking.
