Abstract (en)

[origin: EP0782903A1] The tool (1) has side plates (2,3) with parallel inner faces which act as a handle. One or more implements (3-7) are able to pivot or slide in a plane parallel to the inner surfaces of the side plates. At least one of the side plates has a hole (10) in it to receive bits (20) which can be inserted into it. The hole is shaped so that the bit turns when the handle is rotated. The hole is positioned so that it does not impede the operation of any other implements. It can be equipped with a reversible ratchet mechanism between the two plates. A detachable adapter (23) can also be fitted to another of the implements (7) to receive bits.
