Abstract (en)

[origin: WO9702942A1] Immobilisation for radiation treatment is performed by means of low-temperature thermoplastic sheets individually adjusted to the patient. The edges are secured to the top of the treatment table by complex fixtures. The invention provides a simple means to obtain reliable connection between heat-tolerant edge parts and the thermoplastic material. The edge parts grip and deform the edge during the heating, and adhesion and cooling secure the grip.
