Abstract (en)
[origin: GB2293604A] Dermal fibroblast cells comprise a muscle-specific DNA, preferably the dystrophin gene. Dermal fibroblast cells, optionally comprising the above DNA, are used in the preparation of a cell formulation for administration to a patient such that the said cells are converted to myogenic cells able to produce products expressed by muscle-specific genes. The formulations are of use for the treatment of injury resulting in muscular degeneration, or muscular dystrophy, especially Duchenne's.
