Abstract (en)
[origin: EP0784129A1] A suspended sheet assembly (1) has a sheet (2), for example toughened glass, a supporting element (4) fastened to the sheet (2) and a suspension device (6) for attaching the supporting element (4) to a structure such as the framework of beams in a building. The supporting element (4) has an elongate supporting member (8) and clamping means (26,28,30,32) and extends through an aperture (14) in the sheet (2). The suspension device (6) has a substantially planar attachment portion (22). The elongate supporting member (8) is clamped to the attachment portion (22) with its longitudinal axis X at any of a range of angles to the plane R of the attachment portion (22), and thereby the sheet (2) can be suspended inclined to the horizontal/vertical and to adjacent sheets clamped to the same suspension device (6). <IMAGE>
