Abstract (en)  
[origin: EP0784143A1] The kit comprises one-piece connectors (20,20') and has at least one pane (5,5') of glass inserted in glass strips in a light opening section of a door panel. The glass strips comprise a pair of identical profile strips (11,11'), the contact sides (4,4') of which are directed towards the glass pane. The connectors from the outside invisibly connect the two glass strips, bridging over the distance provided by the glass pane, so that the door glazing is releasable. The building kit comprises two connectors, both having a central rib and two symmetrically arranged arms (14) opposite to the rib. The arms can be secured in grooves (12) in the strips. The one connector (20) is cross-shaped in cross-section and the other has a T-shape. The T-shape can be made by removing of part of the first shape.
