Abstract (en)

[origin: EP0784304A1] The door consists of a fixed frame (1) and an opening panel (2). The frame is made up of upright and curved cross-members. The door panel flexes to match the curvature of the frame when closed. The door panel is joined to the frame along one side by fixings (31), and along the other side by opening couplings (41,43,44) set at intervals along the frame uprights. The door has a window in it made from a flexible and deformable material such as polymethyl methacrylate, and the opening couplings are in the form of quarter-turn catches.
