Abstract (en)

[origin: EP0784957A2] The control element has a central part adapted for the housing of the apparatus and at least one switch mounted on it. There is a fastening leg which can be deactivated in the "assembly end-position of the apparatus" between the switch and the central part and there are other elements for movable location of the switch on the central part. These other elements are designed to form an effective bearing between the switch and the central part. They engage each other in positive locking fashion. In the direction of the switch, there is on the central part a tongue as one such element, with a hook as the other on the switch.
