Abstract (en)

The invention refers to a door or window locking device intended for installation into a door wing frame or window wing frame and, in particular, into a narrow frame made, e.g., of aluminum or plastic profiles, or into a door wing itself. The locking device comprises a translationally movable bolt displaceable with a lock cylinder bit through corresponding linkage into a door or window post, and vice versa. The bolt 5 is slidingly movably arranged between a flat slider 6 and a coupling link 7. The slider 6 to which presses one leg of a return spring 9 is guided so as to move perpendicularly to the direction of the path of the bolt 5 only, and the coupling link 7 is guided in a manner so as to move in the same direction as the bolt 5 itself only. The bolt 5 is articulated with a swing arm 8 arranged between the flat slider 6 and the coupling link 7. <IMAGE>
