Abstract (en)

[origin: EP0786751A2] The housing bolted to a wall (1) consists of a rear section (2) and a front section (3) screwed together (4). The bolt (8) passes through the upper part (21) of a banjo-shaped opening in the rear section, whose lower part (22) has a larger diameter than the bolt head. The position of the bolt is monitored by a switch (6) mounted on an insert (7) screwed (5) to the front section. When the housing is fitted around the protruding head of the bolt, the latter actuates a tongue (61) which instigates a remote alarm if the housing is removed by an unauthorised person.
