Abstract (en)

[origin: EP0787460A2] The piece has a main body (5) with inner and outer layers (7,8) of material joined together at both sides of a slot (11) into which a sliding closure element (6) is guided. The aperture (4) formed by aligned holes (9,10) in the respective layers is surrounded by an abutment surface (27) for the sealing body (25) of the cleaner. The ring (26) protrudes through the hole (10) in the outer layer (8) and, like the main body and/or the sliding element, is sufficiently flexible for the latter to be movable over the ring into the closed position.
