Abstract (en)

[origin: EP0790006A2] The method involves detecting the intensity of X-rays (8) passing through a cigarette chord (6) and processing (16) the resulting intensity signal into a signal representing the density of the chord. The intensity of the X-rays is separately detected at a number of different heights on the chord. Measurement signals (S<sub>1</sub> - S<sub>n</sub>) representing the detected intensities are processed to form a single density signal (17). At each chord height position the intensity of a part of the X-rays passing through a section with negligible density inhomogeneity is detected.
