Abstract (en)
[origin: WO9713054A1] The invention pertains to a section for lining hollow cavities, in particular for timbering and walling tunnels. The section has a substantially shell-shaped main unit (20) bounded by an inner face (23), an outer face (22) and edge faces (21). At least one aperture (3) is provided along the edge faces (21) for accommodating a dowel (5). According to the invention it is proposed that the aperture (3) should be formed from a substantially cylindrical bore into which protrudes a tube (4) which is deformable to a limited degree, a gap (a) being left between the outer circumference of the tube (4) and the wall of the bore.
