Abstract (en)

[origin: EP0791307A1] The container/applicator consists of one or more containers (5), each with an applicator (8) which has a seal between it and the container. The containers are located inside a shell (1) which allows free access to each container's opening, and each applicator has a pivoted handle (7) equipped with a lug which engages with a stop (11) on the shell to compress the seal when the handle is in its folded position. The shell can be made in two clip-together halves, and it can be shaped to hold two containers with their ends facing in opposite directions, with flexible clips to hold the applicators' handles in the folded position.
