Abstract (en)

A recording medium is provided which enables a good print to be formed on both surfaces thereof and, when printing on one surface of the recording medium is performed under conditions different from that in the printing on the other surface of the recording medium, causes neither curling nor strike through of the print. The recording medium comprises: a substrate having two faces; and an ink-receptive layer or a coat layer provided on both faces of the substrate to form a first surface and a second surface opposite the first surface, wherein when a droplet of an ink in an identical amount is deposited onto the first and second surfaces of the recording medium, the diameter of a dot formed on the first surface is different from that of a dot formed on the second surface.
