Abstract (en)

[origin: EP0792982A2] The lock includes a follower which when operated causes an entrainment member to interact with a stop designed so that the exit of the spring bolt from the inverted plate is restricted by a damped buffer. The run-up face has at least a first surface (7) and second surface (8). The buffer consists of a stop bolt with the damper mounted thereon. A lining can be provided on the stop to dampen the strike on the stop bolt. The intersection (10) of the first surface with the second surface is outside of the centre of spring bolt.
