Abstract (en)

[origin: WO9712452A1] A radio receiving and transmitting device (27) includes a receiver (50) receiving a radio signal (24) carrying an audio and a data component, a memory (54) coupled to the receiver (50) and storing at least some data from the data component, and a transmitter (56) in communication with the memory (54). The transmitter (56) transmits at least some of the data in the memory (54) over a wireless communication system control channel. A method of accessing information via a wireless communication system comprising the steps of receiving a message including a wireless subscriber number and radio broadcast data at a communication unit within the wireless communication system, mapping the wireless subscriber number into a wireless subscriber computer network address; and transmitting the radio broadcast data and the computer address to a radio broadcast data system (20) in communication with the wireless communication system.
