Abstract (en)

[origin: EP0794398A2] There is described a new type of supporting frame for the mechanical part of a machine for the production of ice cubes, that is easily adaptable to machines with different axial dimensions. For this object the frame consists of terminal shoulders (13, 14) that are the same for all the models of the machine, connected together by metal section beams (15) with a length that varies from one machine to the other. (Fig. 4).
