Abstract (en)

[origin: EP0795620A1] A method is described for forming a hardened coating on a workpiece, such as a corrugating roll (22), having an undulated surface. With the method, a high velocity oxygen fueled gun (26) is aligned with the undulated surface and a coating material is sprayed onto the surface from the gun to form a hardened coating having substantially uniform surface characteristics. The coating material is a tungsten carbide-cobalt material, or other hard carbide or oxide materials, which is sprayed onto the surface in a direction which is parallel to and offset from a plane passing through the longitudinal center of the roll (22). During the spraying operation, the gun (26) is traversed along the length of the roll while the roll is rotated. <IMAGE>
